

# Signs of the Polarizations

1998

## Target Polarization

The sign of the field was checked with a Hall probe which was in turn double checked using the Moeller dipole and also a coil with a visible direction of winding.

| V coil<br>on the power supply | Bz | Pz targ |
|-------------------------------|----|---------|
| -                             | +  | -       |
| +                             | -  | +       |

## Beam Polarization

The sign of the beam polarization was estimated on Apr,28-30 data (HAPPEX). For the 1/2 wavelength plate removed, during the logical "1" of the sync. wave the beam polarization occurred to be *positive* .
