Remote connections

Last updated: Mon, 26 Apr 2008 moller@jlab.org

One can connect remotely to the serial interfaces of the VME cpu boards and the HV crate using a Port-Server:

- telnet hatsv5 2003 - connecting to halladaq14 (129.57.164.39)
- telnet hatsv5 2004 - connecting to hallavme5 (129.57.192.31)
- telnet hatsv5 2011 (moved to port 2003 since March 29, 2008) - connecting to the HV crate (hac42) (hv channels#: 5.00-5.11)

In order to disconnect, type:

- Ctrl] - breaks the connection
- telnet> quit - quits telnet

One should always disconnect since otherwise the session may be hanging up preventing other connections. In such a case one has to login into the server and kill the session.
