

Moeller focusing test 4/7/2000

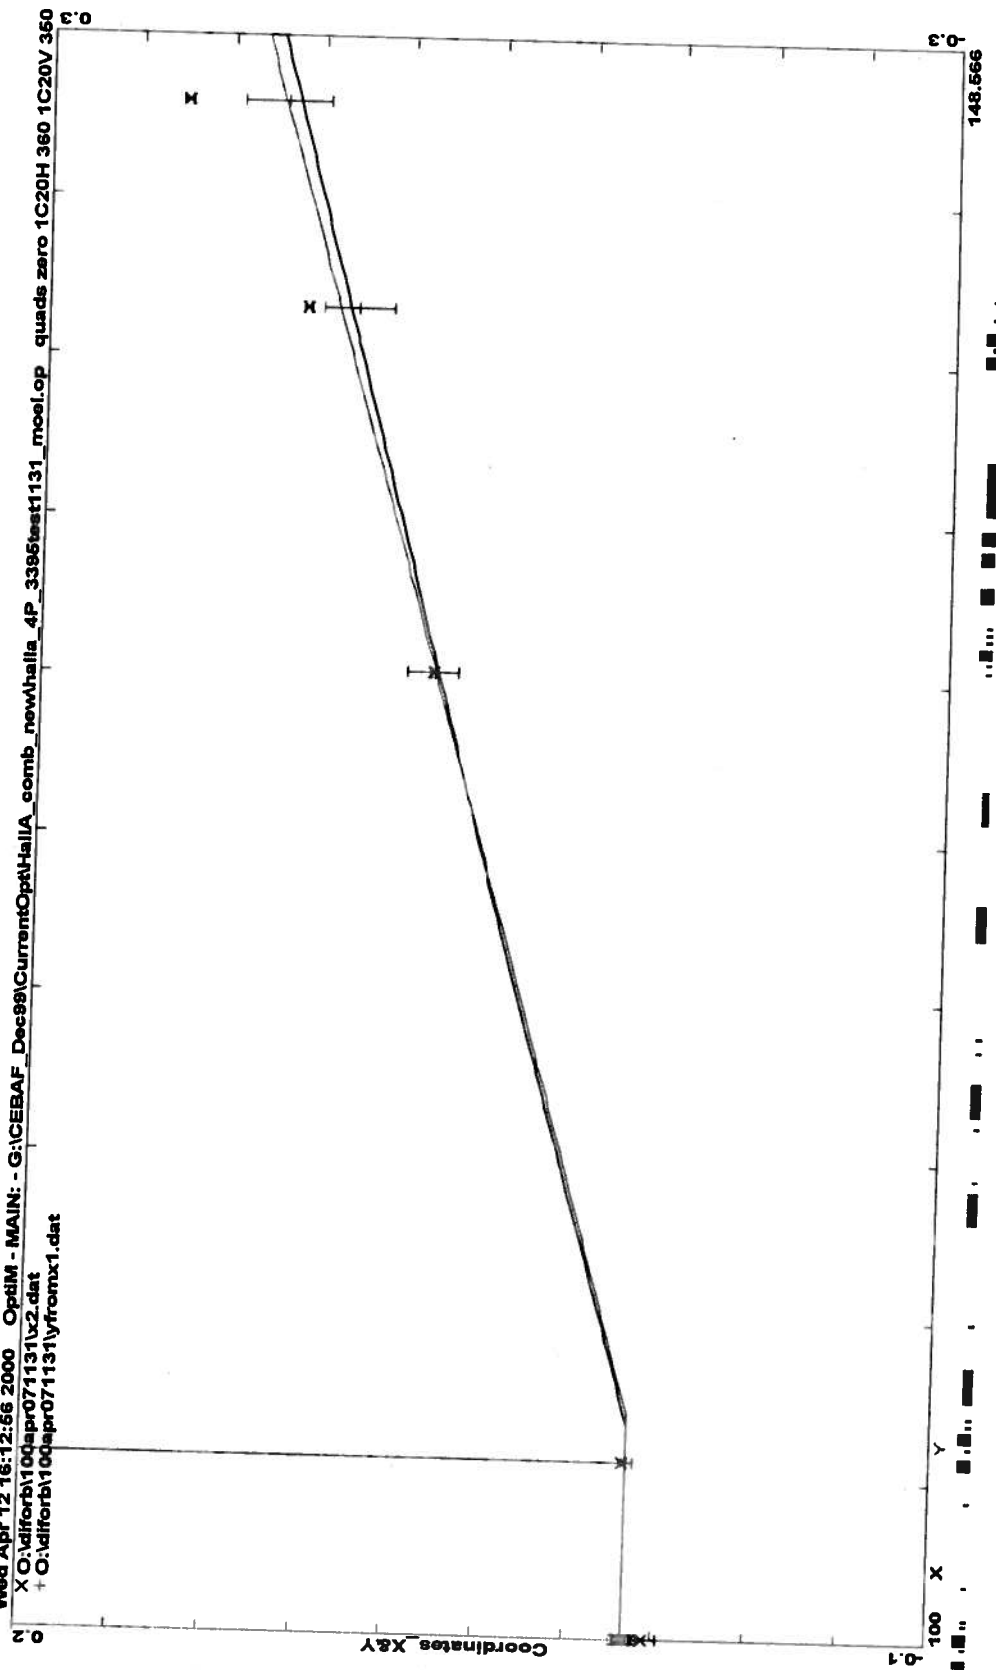

1. FOPT2 was used to excite correctors 1C20V, 1C20H, 1H01H and 1H01V in sequence with a step size of 500 G-cm
2. Data was taken in five quad configurations:
 - a. All six 1H quads at design values for 3395 MeV
 - b. Six 1H quads zero
 - c. 1H01 positive, 1H02 positive (due to flipped leads), others zero
 - d. 1H01 positive, 1H03 negative, others zero
 - e. 1H01 positive, 1H03A positive (flipped leads), others zero
3. Quads changed were cycled between tests. No cycle before first data set.
3. Data was imported to Optim and fit by eye using the corrector strength as a free parameter. Fits shown have

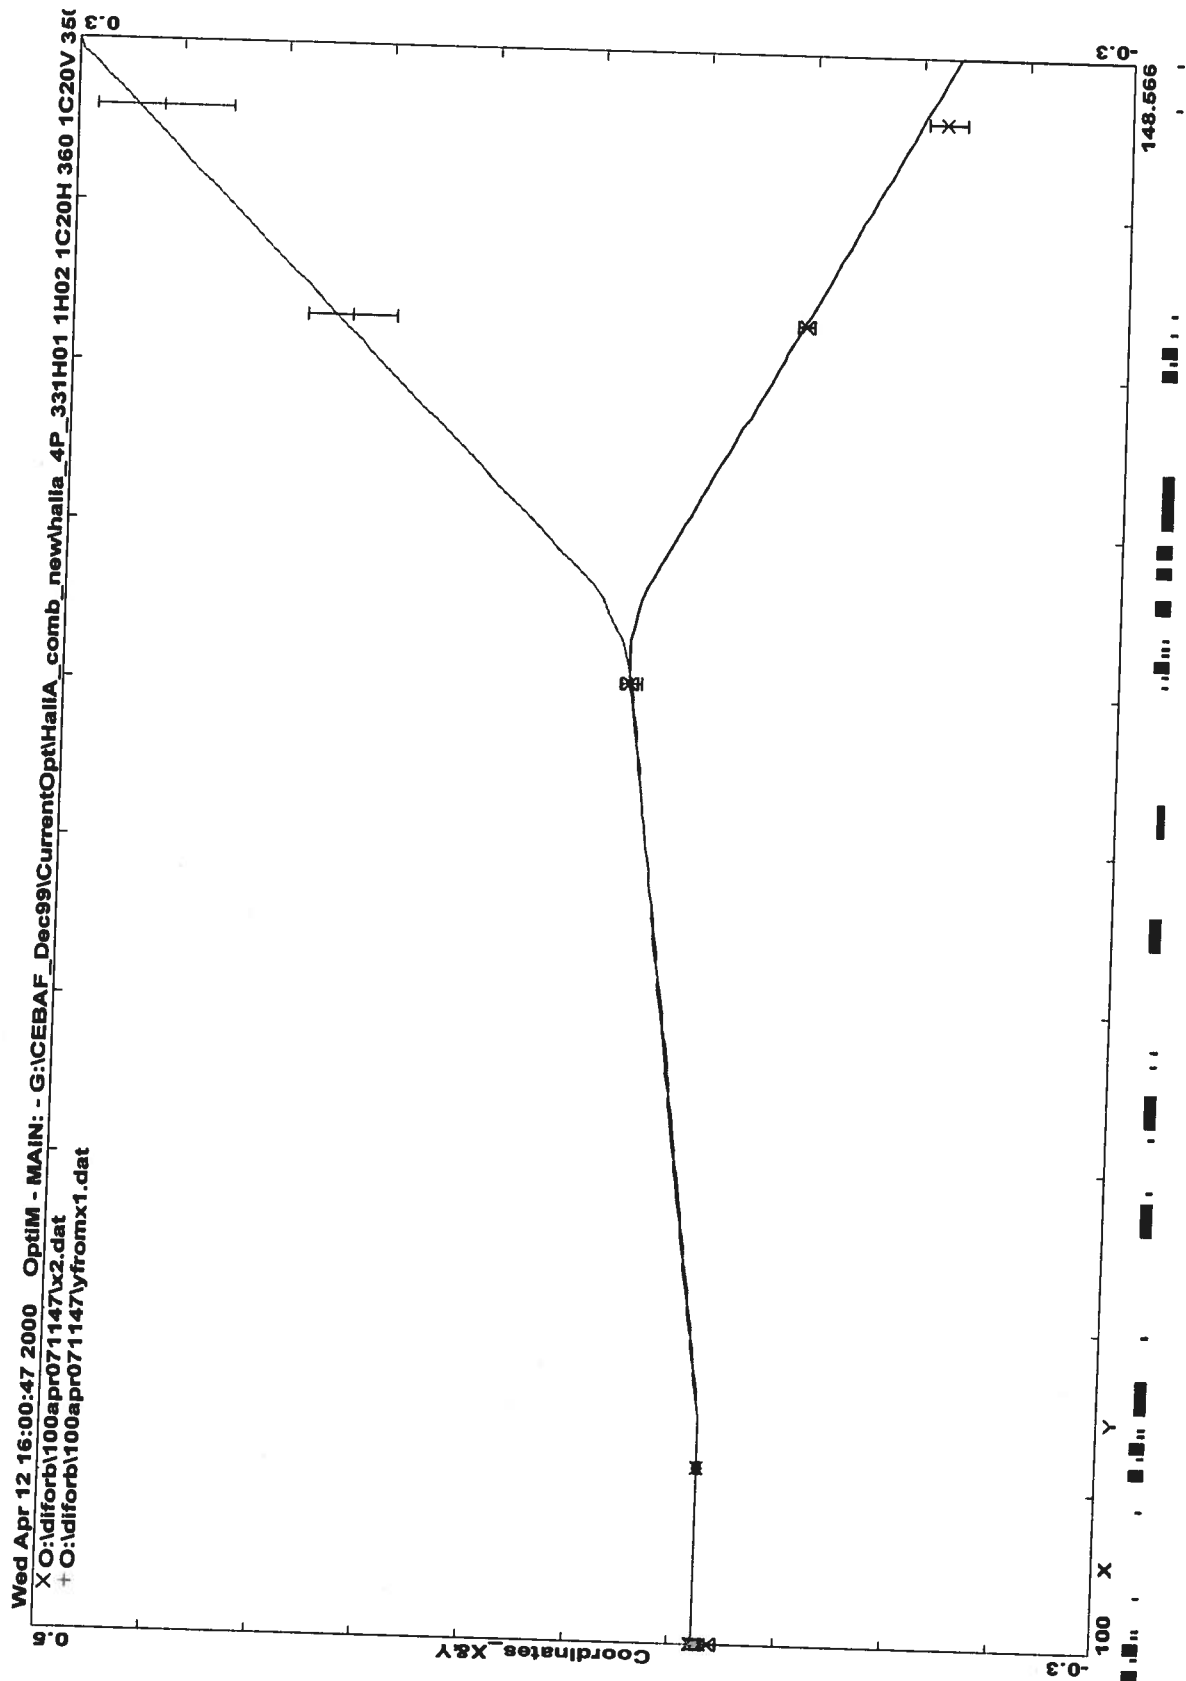

1C20H	360 G-cm
1C20V	350 G-cm
1H01H	250 G-cm
1H01V	-450 G-cm (data showed corrector has flipped leads)
